

TPS22811x 2.7 V – 16 V, 10-A, 6-mΩ Load Switch with Adjustable Overvoltage Protection and Current Monitoring

1 Features

- Wide operating input voltage range: 2.7 V to 16 V
 - 20-V absolute maximum
- Integrated FET with low on-resistance: $R_{ON} = 6\text{ m}\Omega$ (typ.)
- Adjustable output slew rate control (dVdt)
- Active high enable input with adjustable undervoltage lockout (UVLO)
- Active low enable input with adjustable undervoltage lockout (OVLO)
- Fast overvoltage protection
 - Adjustable overvoltage lockout (OVLO) with 1.2-μs (typ.) response time
- Analog load current monitor output (IMON)
 - • ±9 % accuracy for $I_{OUT} > 3\text{ A}$
- Fast-trip response for short-circuit protection in steady-state
 - 640-ns (typ.) response time
 - Fixed threshold
- Overtemperature protection
- Power-good (PG) indication with adjustable threshold (PGTH)
- Quick Output Discharge
- Small footprint: QFN 2 mm × 2 mm, 0.45-mm pitch

2 Applications

- [Optical modules](#)
- [Server/PC motherboard/add-on cards](#)
- [Enterprise routers/data center switches](#)
- [Industrial PC](#)
- [UHDTV](#)

3 Description

The TPS22811x is a highly-integrated, power-distribution solution in a small package. The device allows control and monitoring of power supply rails using minimum number of external components.

Output slew rate and inrush current can be adjusted using one external capacitor. Loads are protected from input overvoltage conditions by cutting off the output if input exceeds an adjustable overvoltage threshold. The device integrates a fast-trip response to provide protection against severe faults at the output during steady-state.

The devices provide an accurate analog sense of the output load current as well as a digital power-good indication to help with system monitoring and diagnostics.

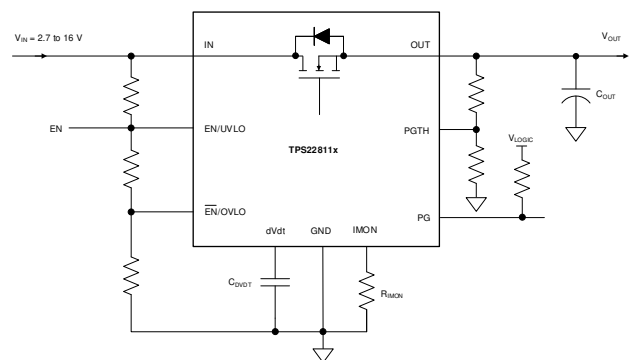

The devices are available in a 2-mm × 2-mm, 10-pin HotRod™ QFN package for improved thermal performance and reduced system footprint.

The devices are characterized for operation over a junction temperature range of –40°C to +125°C.

Device Information

PART NUMBER	PACKAGE ⁽¹⁾	BODY SIZE (NOM)
TPS22811	RPW (VQFN-HR, 10)	2.00 mm × 2.00 mm

- (1) For all available packages, see the orderable addendum at the end of the data sheet.

5 Pin Configuration and Functions

Figure 5-1. TPS22811x RPW Package 10-Pin QFN Top View

Table 5-1. Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
EN/UVLO	1	Analog Input	Active high enable for the device. A resistor divider on this pin from input supply to GND can be used to adjust the Undervoltage Lockout threshold. <i>Do not leave floating.</i> Refer to Undervoltage Lockout (UVLO and UVP) for details.
$\overline{\text{EN}}/\text{OVLO}$	2	Analog Input	A resistor divider on this pin from supply to GND can be used to adjust the overvoltage lockout threshold. This pin can also be used as an active low enable for the device. <i>Do not leave floating.</i> Refer to Overvoltage Lockout (OVLO) for more details.
PG	3	Digital Output	Power-good indication. This pin is an open-drain signal which is asserted high when the internal power path is fully turned ON and PGTH input exceeds a certain threshold. Refer to Power-Good Indication (PG) for more details.
PGTH	4	Analog Input	Power-good threshold. Refer to Power-Good Indication (PG) for more details.
IN	5	Power	Power input
OUT	6	Power	Power output
DVDT	7	Analog Output	A capacitor from this pin to GND sets the output turn on slew rate. Leave this pin floating for the fastest turn on slew rate. Refer to Slew Rate (dVdt) and Inrush Current Control for more details.
GND	8	Ground	This pin is the ground reference for all internal circuits and must be connected to system GND.
IMON	9	Analog Output	Analog load current monitor output. An external resistor from this pin to GND sets the gain for the current monitor. This pin also provides a secondary function of setting the current limit during start-up. Connect to GND if neither of these features are used. <i>Do not leave floating.</i> Refer to Analog Load Current Monitor and Active Current Limiting During Start-Up for more details.
DNC	10	X	Do not connect anything to this pin.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

Parameter		Pin	MIN	MAX	UNIT
V _{IN}	Maximum input voltage range, $-40^{\circ}\text{C} \leq T_J \leq 125^{\circ}\text{C}$	IN	-0.3	20	V
V _{OUT}	Maximum output voltage range, $-40^{\circ}\text{C} \leq T_J \leq 125^{\circ}\text{C}$	OUT	-0.3	V _{IN} + 0.3	
V _{OUT,PLS}	Minimum output voltage pulse (< 1 μs)	OUT	-0.8		
V _{EN/UVLO}	Maximum Enable pin voltage range	EN/UVLO	-0.3	6.5	V
V _{OV}	Maximum $\overline{\text{EN}}$ /OVLO pin voltage range	$\overline{\text{EN}}$ /OVLO	-0.3	6.5	V
V _{dVdT}	Maximum dVdT pin voltage range	dVdT	Internally limited		V
V _{PG}	Maximum PG pin voltage range	PG	-0.3	6.5	V
V _{PGTH}	Maximum PGTH pin voltage range	PGTH	-0.3	6.5	V
V _{IMON}	Maximum IMON pin voltage range	IMON	Internally limited		V
I _{MAX}	Maximum continuous switch current	IN to OUT	10		A
T _J	Junction temperature		Internally limited		$^{\circ}\text{C}$
T _{LEAD}	Maximum lead temperature		300		$^{\circ}\text{C}$
T _{stg}	Storage temperature		-65	150	$^{\circ}\text{C}$

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	± 2000	V
		Charged device model (CDM), per ANSI/ESDA/JEDEC JS-002 ⁽²⁾	± 500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

Parameter		Pin	MIN	MAX	UNIT
V _{IN}	Input voltage range	IN	2.7	16	V
V _{OUT}	Output voltage range	OUT		V _{IN}	V
V _{EN/UVLO}	EN/UVLO pin voltage range	EN/UVLO		5 ⁽¹⁾	V
V _{OV}	$\overline{\text{EN}}$ /OVLO pin voltage range	$\overline{\text{EN}}$ /OVLO	0.5	1.5	V
V _{dVdT}	dVdT pin capacitor voltage rating	dVdT	V _{IN} + 5 V		V
V _{PGTH}	PGTH pin voltage range	PGTH		5	V
V _{PG}	PG pin voltage range	PG		5	V
I _{MAX}	Continuous switch current, $T_J \leq 125^{\circ}\text{C}$	IN to OUT		10	A
T _J	Junction temperature		-40	125	$^{\circ}\text{C}$

- (1) For supply voltages below 5 V, it is okay to pull up the EN pin to IN directly. For supply voltages greater than 5 V, TI recommends to use a resistor divider with minimum pullup resistor value of 350 k Ω .

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TPS25981xx	UNIT
		RPW (QFN)	
		10 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	49.7 ⁽²⁾	°C/W
		71.8 ⁽³⁾	°C/W
R _{θJB}	Junction-to-board thermal resistance	15.7	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	2.1 ⁽²⁾	°C/W
	Junction-to-top characterization parameter	1.3 ⁽³⁾	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	23 ⁽²⁾	°C/W
		14.5 ⁽³⁾	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.
- (2) Based on simulations conducted with the device mounted on a custom 4-layer PCB (2s2p) with 8 thermal vias under device.
- (3) Based on simulations conducted with the device mounted on a JEDEC 4-layer PCB (2s2p) with no thermal vias under device.

6.5 Electrical Characteristics

(Test conditions unless otherwise noted) $-40^{\circ}\text{C} \leq T_J \leq 125^{\circ}\text{C}$, $V_{\text{IN}} = 12\text{ V}$, $\text{OUT} = \text{Open}$, $V_{\text{EN/UVLO}} = 2\text{ V}$, $V_{\text{OVLO}} = 0\text{ V}$, $R_{\text{IMON}} = 600\ \Omega$, $dV/dt = \text{Open}$, $\text{PGTH} = \text{Open}$, $\text{PG} = \text{Open}$. All voltages referenced to GND.

Test Parameter	Description	MIN	TYP	MAX	UNITS
INPUT SUPPLY (IN)					
$I_{\text{Q(ON)}}$	IN supply quiescent current		381	470	μA
$I_{\text{Q(OFF)}}$	IN supply OFF state current ($V_{\text{SD(F)}} < V_{\text{EN}} < V_{\text{UVLO(F)}}$)		68	90	μA
I_{SD}	IN supply shutdown current ($V_{\text{EN}} < V_{\text{SD(F)}}$)		3	25	μA
$V_{\text{UVP(R)}}$	IN supply UVP rising threshold	2.44	2.53	2.64	V
$V_{\text{UVP(F)}}$	IN supply UVP falling threshold	2.35	2.42	2.55	V
OUTPUT LOAD CURRENT MONITOR (IMON)					
G_{IMON}	Analog load current monitor gain ($I_{\text{MON}} : I_{\text{OUT}}$), $I_{\text{OUT}} = 1.5\text{ A}$, $I_{\text{OUT}} < I_{\text{LIM}}$	82.9	95.3	107.6	$\mu\text{A/A}$
	Analog load current monitor gain ($I_{\text{MON}} : I_{\text{OUT}}$), $I_{\text{OUT}} = 3\text{ A}$, $I_{\text{OUT}} < I_{\text{LIM}}$	87	95.3	104.5	$\mu\text{A/A}$
	Analog load current monitor gain ($I_{\text{MON}} : I_{\text{OUT}}$), $I_{\text{OUT}} = 4.5\text{ A}$, $I_{\text{OUT}} < I_{\text{LIM}}$	87.6	95.3	103.1	$\mu\text{A/A}$
	Analog load current monitor gain ($I_{\text{MON}} : I_{\text{OUT}}$), $I_{\text{OUT}} = 8\text{ A}$, $I_{\text{OUT}} < I_{\text{LIM}}$	87.7	95.3	102.6	$\mu\text{A/A}$
	Analog load current monitor gain ($I_{\text{MON}} : I_{\text{OUT}}$), $I_{\text{OUT}} = 10\text{ A}$, $I_{\text{OUT}} < I_{\text{LIM}}$	87.8	95.3	102.4	$\mu\text{A/A}$
SHORT-CIRCUIT PROTECTION (OUT)					
I_{FT}	Fixed fast-trip current threshold		39.5		A
ON RESISTANCE (IN - OUT)					
R_{ON}	$2.7 \leq V_{\text{IN}} \leq 4\text{ V}$, $I_{\text{OUT}} = 3\text{ A}$, $T_J = 25^{\circ}\text{C}$		6.07		m Ω
	$4 < V_{\text{IN}} \leq 16\text{ V}$, $I_{\text{OUT}} = 3\text{ A}$, $T_J = 25^{\circ}\text{C}$		5.81		m Ω
	$2.7 \leq V_{\text{IN}} \leq 16\text{ V}$, $I_{\text{OUT}} = 3\text{ A}$, $-40^{\circ}\text{C} \leq T_J \leq 125^{\circ}\text{C}$			8.4	m Ω
ENABLE/UNDERVOLTAGE LOCKOUT (EN/UVLO)					
$V_{\text{UVLO(R)}}$	EN/UVLO rising threshold	1.176	1.20	1.224	V
$V_{\text{UVLO(F)}}$	EN/UVLO falling threshold	1.073	1.09	1.116	V
$V_{\text{SD(F)}}$	EN/UVLO falling threshold for lowest shutdown current	0.45	0.75		V

6.6 Timing Requirements

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_{OVLO}	Overvoltage lock-out response time	$V_{OVLO} > V_{OV(R)}$ to $V_{OUT} \downarrow$		1.2		μs
t_{FT}	Fixed fast-trip response time	$I_{OUT} > I_{FT}$ to $I_{OUT} \downarrow$		640		ns
t_{PGA}	PG assertion de-glitch time			14		μs
t_{PGD}	PG de-assertion de-glitch time			14		μs

6.7 Switching Characteristics

The output rising slew rate is internally controlled and constant across the entire operating voltage range to ensure the turn on timing is not affected by the load conditions. The rising slew rate can be adjusted by adding capacitance from the dVdt pin to ground. As C_{dVdt} is increased it slows the rising slew rate (SR). See Slew Rate and Inrush Current Control (dVdt) section for more details. The Turn-Off Delay and Fall Time, however, are dependent on the RC time constant of the load capacitance (C_{OUT}) and Load Resistance (R_L). The Switching Characteristics are only valid for the power-up sequence where the supply is available in steady-state condition and the load voltage is completely discharged before the device is enabled. Typical values are taken at $T_J = 25^\circ\text{C}$ unless specifically noted otherwise. $R_L = 100\ \Omega$, $C_{OUT} = 1\ \mu\text{F}$.

PARAMETER		V_{IN}	$C_{dVdt} = \text{Open}$	$C_{dVdt} = 1800\ \text{pF}$	$C_{dVdt} = 3300\ \text{pF}$	UNITS
SR_{ON}	Output rising slew rate	2.7 V	8.19	1.30	0.78	V/ms
		5 V	11.28	1.42	0.84	
		12 V	19.71	1.68	0.98	
$t_{D,ON}$	Turn-on delay	2.7 V	0.14	0.46	0.70	ms
		5 V	0.14	0.60	0.96

7 Detailed Description

7.1 Overview

TPS22811x is an integrated load switch with protection and monitoring. The device starts its operation by monitoring the IN bus. When the input supply voltage (V_{IN}) exceeds the undervoltage protection threshold (V_{UVP}), the device samples the EN/UVLO pin. A high level ($> V_{UVLO}$) on this pin enables the internal power path to start conducting and allow current to flow from IN to OUT. When EN/UVLO is held low ($< V_{UVLO}$), the internal power path is turned off.

After a successful start-up sequence, the device now actively monitors its load current and input voltage, and controls the internal FET to ensure that the fast-trip current threshold is not exceeded and overvoltage spikes are cut-off after they cross the user adjustable overvoltage lockout threshold (V_{OVLO}). This feature keeps the system safe from harmful levels of voltage and current.

The device also has a built-in thermal sensor based shutdown mechanism to protect itself in case the device temperature (T_J) exceeds the recommended operating conditions.

The schematic diagram illustrates the internal architecture of the TPS22811x, a high-frequency, low-voltage differential-mode (VDM) MOSFET driver. The circuit is organized around several key functional blocks and control logic:

- Input and Output Stages:** The input (IN) is connected to the gate of the HFET (High-Frequency FET). The output (OUT) is connected to the drain of the HFET. The output is also connected to the DVDT (Drain-Source Voltage) pin, which is connected to the IMON (Current Sense) pin. The IMON pin is connected to the CSA (Current Sense Amplifier) and the PGTH (Power Good Threshold) pin.
- Control and Protection Logic:**
 - UVLO (Under-Voltage Lockout):** The UVLO pin is connected to the UVLOb (Under-Voltage Lockout Bias) pin. The UVLOb pin is connected to the UVLOb (Under-Voltage Lockout Bias) pin, which is connected to the UVLOb (Under-Voltage Lockout Bias) pin.
 - OVLO (Over-Voltage Lockout):** The OVLO pin is connected to the OVLOb (Over-Voltage Lockout Bias) pin. The OVLOb pin is connected to the OVLOb (Over-Voltage Lockout Bias) pin, which is connected to the OVLOb (Over-Voltage Lockout Bias) pin.
 - SD (Sense Disable):** The SD pin is connected to the SD (Sense Disable) pin, which is connected to the SD (Sense Disable) pin.
 - PG (Power Good):** The PG pin is connected to the PG (Power Good) pin, which is connected to the PG (Power Good) pin.
 - PGTH (Power Good Threshold):** The PGTH pin is connected to the PGTH (Power Good Threshold) pin, which is connected to the PGTH (Power Good Threshold) pin.
- Temperature Sense and Overtemperature Protection:** The TSD (Temperature Sense and Overtemperature Protection) pin is connected to the TSD (Temperature Sense and Overtemperature Protection) pin, which is connected to the TSD (Temperature Sense and Overtemperature Protection) pin.
- HFET Control:** The HFET Control block is connected to the HFET (High-Frequency FET) and the HFET (High-Frequency FET) pin.
- CSA (Current Sense Amplifier):** The CSA (Current Sense Amplifier) is connected to the IMON (Current Sense) pin and the CSA (Current Sense Amplifier) pin.

The diagram shows the internal logic and components of the TPS22811x, including the input and output stages, control and protection logic, temperature sense and overtemperature protection, HFET control, and current sense amplifier.

7.3 Feature Description

The TPS22811x eFuse is a compact, feature rich power management device that provides detection, protection and indication in the event of system faults.

7.3.1 Undervoltage Lockout (UVLO and UVP)

The TPS22811x implements undervoltage protection on IN in case the applied voltage becomes too low for the system or device to properly operate. The undervoltage protection has a default lockout threshold of V_{UVLO} which is fixed internally. Also, the UVLO comparator on the EN/UVLO pin allows the undervoltage protection threshold to be externally adjusted to a user defined value. Figure 7-1 and Equation 1 show how a resistor divider can be used to set the UVLO set point for a given voltage supply.

Figure 7-1. Adjustable Undervoltage Protection

$$V_{IN(UV)} = \frac{V_{UVLO} \times (R_1 + R_2)}{R_2} \quad (1)$$

7.3.2 Overvoltage Lockout (OVLO)

The TPS22811x allows the user to implement overvoltage lockout to protect the load from input overvoltage conditions. The OVLO comparator on the $\overline{\text{EN}}/\text{OVLO}$ pin allows the overvoltage protection threshold to be adjusted to a user defined value. After the voltage at the $\overline{\text{EN}}/\text{OVLO}$ pin crosses the OVLO rising threshold $V_{OV(R)}$, the device turns off the power to the output. Thereafter, the devices wait for the voltage at the $\overline{\text{EN}}/\text{OVLO}$ pin to fall below the OVLO falling threshold $V_{OV(F)}$ before the output power is turned ON again. The rising and falling thresholds are slightly different to provide hysteresis. Figure 7-2 and Equation 2 show how a resistor divider can be used to set the OVLO set point for a given voltage supply.

Figure 7-2. Adjustable Overvoltage Protection

$$V_{IN(OV)} = \frac{V_{OV} \times (R_1 + R_2)}{R_2} \quad (2)$$

Figure 7-3. TPS22811x Overvoltage Lockout and Recovery

While recovering from a OVLO event, the TPS22811x starts up with inrush control (dVdt).

7.3.3 Inrush Current, Overcurrent, and Short-Circuit Protection

TPS22811x incorporates three levels of protection against overcurrent:

1. Adjustable slew rate (dVdt) for inrush current control
2. Fixed threshold (I_{FT}) for fast-trip response to quickly protect against hard output short circuits during steady-state
3. Adjustable current limit (I_{LIM}) for protection against overcurrent or short circuit during start-up

7.3.3.1 Slew Rate (dVdt) and Inrush Current Control

During hot-plug events or while trying to charge a large output capacitance at start-up, there can be a large inrush current. If the inrush current is not managed properly, it can damage the input connectors and cause the system power supply to droop leading to unexpected restarts elsewhere in the system. The inrush current during turn on is directly proportional to the load capacitance and rising slew rate. Equation 3 can be used to find the slew rate (SR) required to limit the inrush current (I_{INRUSH}) for a given load capacitance (C_{OUT}):

$$SR \left(\frac{V}{ms} \right) = \frac{I_{INRUSH} (mA)}{C_{OUT} (\mu F)} \quad (3)$$

A capacitor can be connected to the dVdt pin to control the rising slew rate and lower the inrush current during turn on. Use Equation 4 to calculate the required C_{dVdt} capacitance to produce a given slew rate.

$$C_{dVdt} (pF) = \frac{3300}{SR \left(\frac{V}{ms} \right)} \quad (4)$$

The fastest output slew rate is achieved by leaving the dVdt pin open.

Note

For $C_{dVdt} > 10$ nF, TI recommends to add a 100-Ω resistor in series with the capacitor on the dVdt pin.

7.3.3.2 Short-Circuit Protection

During an output short-circuit event, the current through the device increases very rapidly. When a severe overcurrent condition is detected, the TPS22811x triggers a fast-trip response to cut off the power path. The device employs a fixed fast-trip threshold (I_{FT}) to protect fast protection against hard short circuits during steady-state. After the current exceeds I_{FT} , the FET is turned off completely within t_{FT} . Thereafter, the device remains off till the device is power cycled or re-enabled using EN/UVLO pin.

Figure 7-4. TPS22811x Short-Circuit Response

7.3.3.3 Active Current Limiting During Start-Up

The TPS22811x devices respond to output overcurrent conditions during start-up by actively limiting the current. If the load current exceeds the set overcurrent threshold (I_{LIM}) set by the IMON pin resistor (R_{IMON}), but stays lower than the fast-trip threshold (I_{FT}), the current limit loop starts regulating the FET to actively limit the current to the set overcurrent threshold (I_{LIM}). Equation 5 can be used to calculate the R_{IMON} value for a desired overcurrent threshold.

$$R_{IMON}(\Omega) = \frac{6595}{I_{IIM}(A)} \quad (5)$$

Note

1. Leaving the IMON pin open sets the current limit to nearly zero and results in the part entering current limit with the slightest amount of loading at the output.
2. The current limit circuit employs a foldback mechanism. The current limit threshold in the foldback region ($0\text{ V} < V_{\text{OUT}} < V_{\text{FB}}$) is lower than the target current limit threshold (I_{LIM}).
3. Connecting the IMON pin to GND disables the active current limit protection during start-up.

During active current limit, the output voltage drops, resulting in increased device power dissipation across the FET. If the device internal temperature (T_J) exceeds the thermal shutdown threshold (TSD), the FET is turned off. After the part shuts down due to TSD fault, it stays latched off. For more details on device response to overtemperature, see [Overtemperature Protection \(OTP\)](#).

7.3.4 Analog Load Current Monitor

The TPS22811x allows the system to accurately monitor the output load current by providing an analog current sense output on the IMON pin which is proportional to the current through the FET. The user can sense the voltage (V_{IMON}) across the R_{IMON} to get a measure of the output load current.

$$I_{LOAD} (A) = \frac{V_{IMON} (\mu V)}{G_{IMON} (\mu A/A) \times R_{IMON} (\Omega)} \quad (6)$$

The waveform below shows the IMON signal response to a load step at the output.

$V_{IN} = 12\text{ V}$, $R_{IMON} = 649\ \Omega$, I_{OUT} varied dynamically between 8 A and 14 A

Figure 7-5. Analog Load Current Monitor Response

7.3.5 Overtemperature Protection (OTP)

The device monitors the internal die temperature (T_J) at all times and shuts down the part as soon as the temperature exceeds a safe operating level (TSD) thereby protecting the device from damage. The device does turn back on until the junction cools down sufficiently, that is the die temperature falls below ($TSD - TSD_{HYS}$).

When the TPS22811x detects thermal overload, it shuts down and remains latched-off until the device is power cycled or re-enabled.

Table 7-1. Thermal Shutdown

Enter TSD	Exit TSD
$T_J \geq TSD$	$T_J < TSD - TSD_{HYS}$ V_{IN} cycled to 0 V and then above $V_{UVP(R)}$ or EN/UVLO toggled below $V_{SD(F)}$

7.3.6 Fault Response

The following table summarizes the device response to various fault conditions.

Table 7-2. Fault Summary

Event	Protection Response	Fault Latched Internally
Overtemperature	Shutdown	Y
Undervoltage (UVP or UVLO)	Shutdown	N
Input overvoltage	Shutdown	N
Output short circuit to GND	Fast-trip	Y

Faults which are latched internally can be cleared either by power cycling the part (pulling V_{IN} to 0 V) or by pulling the EN/UVLO pin voltage below V_{SD} .

During a latched fault, pulling the EN/UVLO just below the UVLO threshold has no impact on the device.

7.3.7 Power-Good Indication (PG)

The TPS22811x provides an active high digital output (PG) which serves as a power-good indication signal and is asserted high depending on the voltage at the PGTH pin along with the device state information. The PG is an open-drain pin and must be pulled up to an external supply.

After power up, PG is pulled low initially. The device initiates a inrush sequence in which the HFET is turned on in a controlled manner. When the HFET gate voltage reaches the full overdrive indicating that the inrush sequence is complete and the voltage at PGTH is above $V_{PGTH(R)}$, the PG is asserted after a de-glitch time (t_{PGA}).

PG is de-asserted if at any time during normal operation, the voltage at PGTH falls below $V_{PGTH(F)}$, or the device detects a fault (except overcurrent). The PG de-assertion de-glitch time is t_{PGD} .

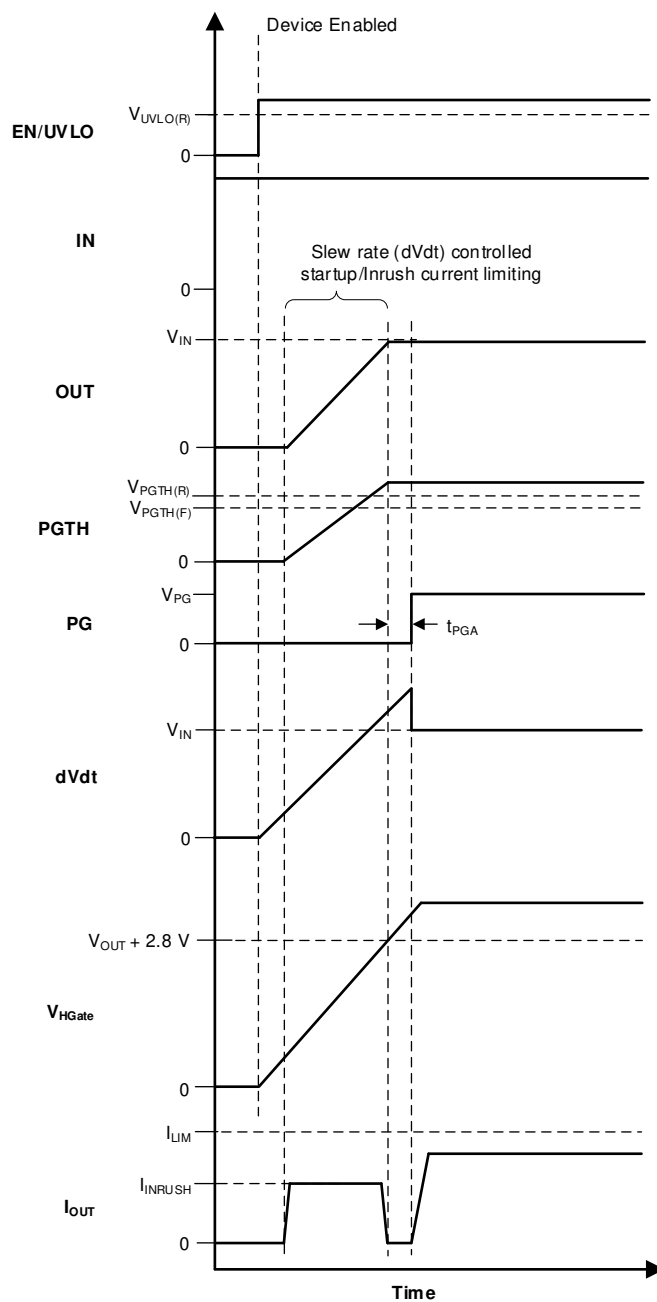

Figure 7-6. TPS22811xx PG Timing Diagram

Table 7-3. TPS22811x PG Indication Summary

Event	Protection Response	PG Pin	PG Delay
Undervoltage (UVP or UVLO)	Shutdown	L	
Overvoltage (OVLO)	Shutdown	L (If PGTH pin voltage < $V_{PGTH(F)}$)	t_{PGD}
Steady-state	NA	H (If PGTH pin voltage > $V_{PGTH(R)}$) L (If PGTH pin voltage < $V_{PGTH(F)}$)	t_{PGA} t_{PGD}
Output short circuit to GND	Fast-trip followed by current limit	H (If PGTH pin voltage > $V_{PGTH(R)}$) L (If PGTH pin voltage < $V_{PGTH(F)}$)	t_{PGA} t_{PGD}
Overtemperature	Shutdown	L (If PGTH pin voltage < $V_{PGTH(F)}$)	t_{PGD}

When there is no supply to the device, the PG pin is expected to stay low. However, there is no active pulldown in this condition to drive this pin all the way down to 0 V. If the PG pin is pulled up to an independent supply which is present even if the device is unpowered, there can be a small voltage seen on this pin depending on the pin sink current, which is a function of the pullup supply voltage and resistor. Minimize the sink current to keep this pin voltage low enough not to be detected as a logic HIGH by associated external circuits in this condition.

7.3.8 Quick Output Discharge (QOD)

The TPS22811x has an integrated output discharge function which can be helpful in quickly removing residual charge left on the large output capacitors and avoids bus floating at some undefined voltage. The internal QOD pulldown FET on the OUT pin is activated when the EN/UVLO is held low ($V_{EN} < V_{UVLO(F)}$). The output discharge function can result in excess power dissipation inside the device leading to increase in junction temperature. The output discharge is disabled if the junction temperature (T_J) crosses the thermal shutdown threshold (TSD) to avoid long term degradation of the part.

7.4 Device Functional Modes

The device has one mode of operation that applies when operated within the Recommended Operating Conditions.

8 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

The TPS22811x is a 2.7-V to 16-V, 10-A load switch that is typically used for power rail protection applications. The device operates from 2.7 V to 16 V with adjustable overvoltage and undervoltage protection. The device provides ability to control inrush current. The device can be used in a variety of systems such as server motherboard/add-on cards/NIC, optical modules, enterprise switches/routers, Industrial PC, UHDTV. The design procedure explained in the subsequent sections can be used to select the supporting component values based on the application requirement. Additionally, a spreadsheet design tool, [TPS22811xx Design Calculator](#), is available in the web product folder.

8.1.1 Single Device, Self-Controlled

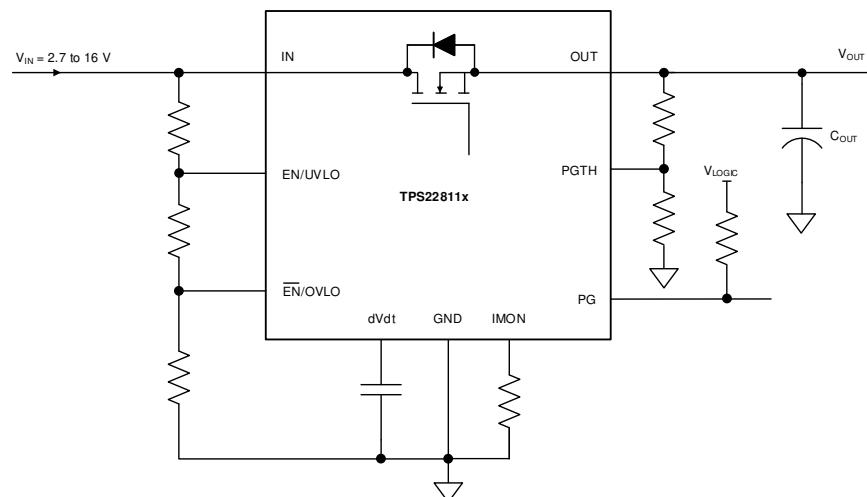

Figure 8-1. Single Device, Self-Controlled

Other variations:

In a Host MCU controlled system, EN/UVLO or OVLO can also be driven from the host GPIO to control the device.

IMON pin can be connected to the MCU ADC input for current monitoring purpose.

8.1.2 Parallel Operation

Applications which need higher steady current can use two TPS22811x devices connected in parallel as shown in [Figure 8-2](#) below. In this configuration, the first device turns on initially to provide the inrush current limiting. The second device is held in an OFF state by driving its EN/UVLO pin low using the PG signal of the first device. After the inrush sequence is complete, the first device asserts its PG pin high and turns on the second device. The second device asserts its PG signal to indicate when it has turned on fully, thereby indicating to the system that the parallel combination is ready to deliver the full steady-state current.

After in steady-state, both devices share current nearly equally. There can be a slight skew in the currents depending on the part-to-part variation in the R_{ON} as well as the PCB trace resistance mismatch.

Figure 8-2. Two Devices Connected in Parallel for Higher Steady-State Current Capability

The waveforms below illustrate the behavior of the parallel configuration during start-up as well as during steady-state.

Figure 8-3. Parallel Devices Sequencing During Start-Up

Figure 8-4. Parallel Devices Load Current During Steady-State

8.2 Typical Application

The TPS22811 device can be used in an industrial PC for input power protection of PCIe card. Industrial PCs provide flexible PCIe expansion slots with different combination of PCIe x16, PCIe x4 and PCI. PCIe x16 slot draws maximum current of up to 5.5 A from on board a 12-V rail. Load switch devices like TPS22811 can support the power requirements of these PCIe expansion slots and can be used for switching 12-V supply to PCIe card. During plugging or unplugging the PCIe card power pin of PCIe slot can short to ground that can cause the 12-V rail to droop or even damage the power tree due to very high current draw. The TPS22811 device can quickly respond to fault events like short circuit and isolate supply from load side thus preventing supply from drooping. The controlled rise time for the device greatly reduces inrush current caused by large bulk load capacitances, thereby reducing or eliminating power-supply droop.

The TPS22811 device can also be used for switching the 12-V bulk power rail of DDR5 DIMM. The PG pin of TPS22811 device can be used to enable downstream DC-DC converters after the 12-V rail is fully up.

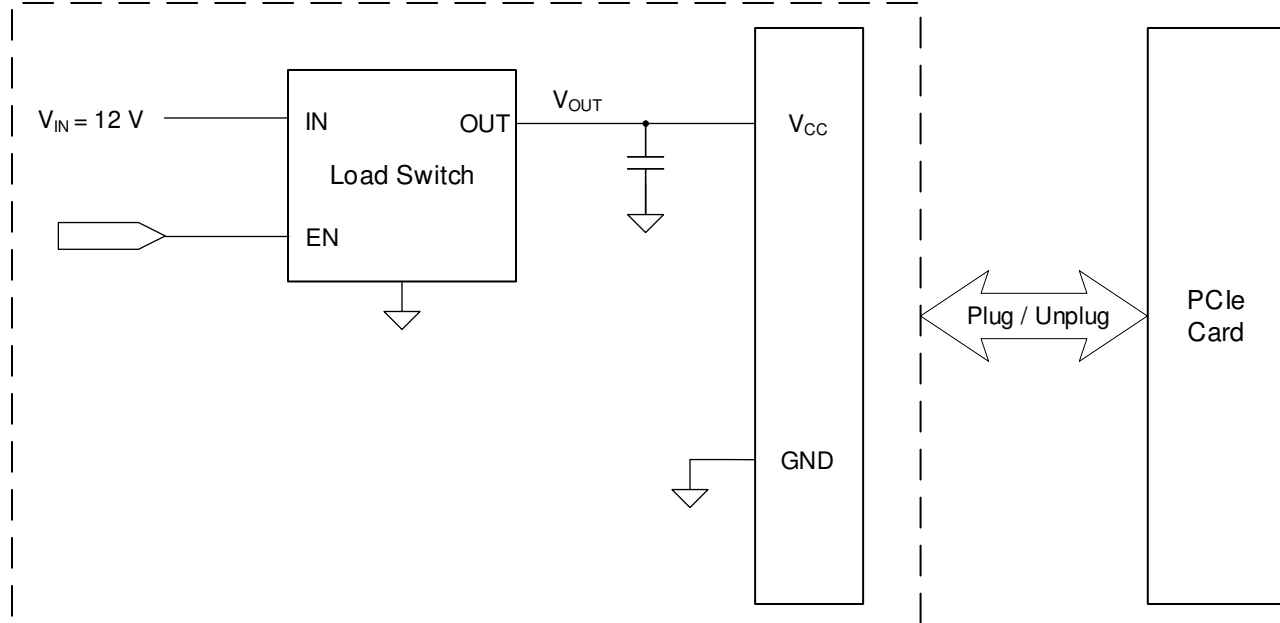

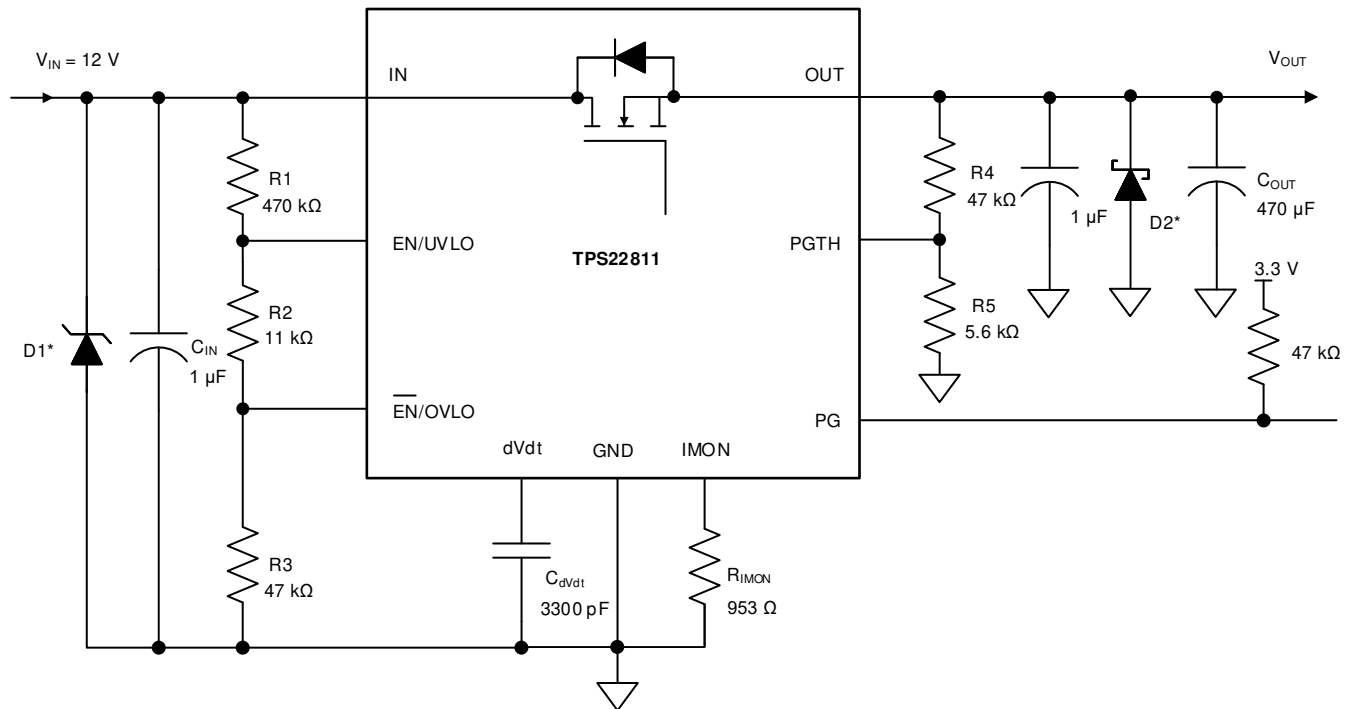

Figure 8-5. Power Path Protection Block Diagram of a Typical PCIe Slot

* Optional circuit components needed for transient protection depending on input and output inductance. Please refer to [Transient Protection](#) section for details.

Figure 8-6. PCIe Expansion Slot Protection

8.2.1 Design Requirements

Table 8-1. Design Parameters

PARAMETER	VALUE
Input supply voltage (V_{IN})	12 V
Undervoltage threshold ($V_{IN(UV)}$)	10.8 V
Overvoltage threshold ($V_{IN(OV)}$)	13.2 V
Output power-good threshold (V_{PG})	11.4 V
Maximum continuous current	5.5 A
Analog load current monitor voltage range ($V_{IMONmax}$)	0.5 V
Output capacitance (C_{OUT})	470 μ F
Output rise time (t_R)	12 ms

8.2.2 Detailed Design Procedure

8.2.2.1 Setting Undervoltage and Overvoltage Thresholds

The supply undervoltage and overvoltage thresholds are set using the resistors R1, R2 and R3. Use [Equation 7](#) and [Equation 8](#) to calculate these values:

$$V_{IN(UV)} = \frac{V_{UVLO(R)} \times (R_1 + R_2 + R_3)}{R_2 + R_3} \quad (7)$$

$$V_{IN(OV)} = \frac{V_{OV(R)} \times (R_1 + R_2 + R_3)}{R_3} \quad (8)$$

Where $V_{UVLO(R)}$ is the UVLO rising threshold and $V_{OV(R)}$ is the OVLO rising threshold. Because R1, R2 and R3 leak the current from input supply V_{IN} , these resistors must be selected based on the acceptable leakage current

from input power supply V_{IN} . The current drawn by R1, R2 and R3 from the power supply is $I_{R123} = V_{IN} / (R1 + R2 + R3)$. However, leakage currents due to external active components connected to the resistor string can add error to these calculations. So, the resistor string current, I_{R123} must be chosen to be 20 times greater than the leakage current expected on the EN/UVLO and OVLO pins.

From the device electrical specifications, both the EN/UVLO and OVLO leakage currents are 0.1 μA (maximum), $V_{OV(R)} = 1.2 V$ and $V_{UVLO(R)} = 1.2 V$. From design requirements, $V_{IN(OV)} = 13.2 V$ and $V_{IN(UV)} = 10.8 V$. To solve the equation, first choose the value of $R1 = 470 k\Omega$ and use the above equations to solve for $R2 = 10.7 k\Omega$ and $R3 = 48 k\Omega$.

Using the closest standard 1% resistor values, we get $R1 = 470 k\Omega$, $R2 = 11 k\Omega$, and $R3 = 47 k\Omega$.

8.2.2.2 Setting Output Voltage Rise Time (t_R)

For a successful design, the junction temperature of device must be kept below the absolute maximum rating during both dynamic (start-up) and steady-state conditions. Dynamic power stresses often are an order of magnitude greater than the static stresses, so it is important to determine the right start-up time and inrush current limit required with system capacitance to avoid thermal shutdown during start-up.

The slew rate (SR) needed to achieve the desired output rise time can be calculated as:

$$SR \left(\frac{V}{ms} \right) = \frac{V_{IN}(V)}{t_R(ms)} = \frac{12 V}{12 ms} = 1 \frac{V}{ms} \quad (9)$$

The C_{dVdt} needed to achieve this slew rate can be calculated as:

$$C_{dVdt}(pF) = \frac{3300}{SR \left(\frac{V}{ms} \right)} = \frac{3300}{1 \frac{V}{ms}} = 3300 pF \quad (10)$$

Choose the nearest standard capacitor value as 3300 pF.

For this slew rate, the inrush current can be calculated as:

$$I_{INRUSH}(mA) = C_{OUT}(\mu F) \times SR \left(\frac{V}{ms} \right) = 470 \mu F \times 1 \frac{V}{ms} = 470 mA \quad (11)$$

The average power dissipation inside the part during inrush can be calculated as:

$$PD_{INRUSH} = 0.5 \times V_{IN}(V) \times I_{INRUSH}(mA) = 0.5 \times 12 V \times 470 mA = 2.82 W \quad (12)$$

For the given power dissipation, the thermal shutdown time of the device must be greater than the ramp-up time t_R to avoid start-up failure. Figure 8-7 shows the thermal shutdown limit, for 2.82 W of power, the shutdown time is more than 10 s which is very large as compared to $t_R = 12 ms$. Therefore, it is safe to use 12 ms as the start-up time for this application.

Figure 8-7. Thermal Shutdown Plot During Inrush

8.2.2.3 Setting Power-Good Assertion Threshold

The power-good assertion threshold can be set using the resistors R4 and R5 connected to the PGTH pin whose values can be calculated as:

$$V_{PG} = \frac{V_{PGTH(R)} \times (R_4 + R_5)}{R_5} \quad (13)$$

Because R4 and R5 leak the current from the output rail VOUT, these resistors must be selected to minimize the leakage current. The current drawn by R4 and R5 from the power supply is $I_{R45} = V_{OUT} / (R_4 + R_5)$. However, leakage currents due to external active components connected to the resistor string can add error to these calculations. So, the resistor string current, I_{R123} must be chosen to be 20 times greater than the PGTH leakage current expected. From the device electrical specifications, PGTH leakage current is 1 μ A (maximum), $V_{PGTH(R)} = 1.2$ V and from design requirements, $V_{PG} = 11.4$ V. To solve the equation, first choose the value of $R_4 = 47$ k Ω and calculate $R_5 = 5.52$ k Ω . Choose nearest 1% standard resistor value as $R_5 = 5.6$ k Ω .

8.2.2.4 Setting Analog Current Monitor Voltage (IMON) Range

The analog current monitor voltage range can be set using the RIMON resistor whose value can be calculated as:

$$R_{IMON} (\Omega) = \frac{V_{IMON} (\mu V)}{G_{IMON} (\mu A/A) \times I_{OUTmax} (A)} = \frac{0.5 \times 10^6}{95 \times 5.5} = 957 \Omega \quad (14)$$

Choose nearest 1% standard resistor value as 953 Ω .

8.2.3 Application Curves

Figure 8-8. Power Up

Figure 8-9. Overvoltage Response

Figure 8-10. Output Short-Circuit During Steady-State

9 Power Supply Recommendations

The TPS22811x devices are designed for a supply voltage range of $2.7\text{ V} \leq V_{IN} \leq 16\text{ V}$. TI recommends an input ceramic bypass capacitor higher than $0.1\text{ }\mu\text{F}$ if the input supply is located more than a few inches from the device. The power supply must be rated higher than the set current limit to avoid voltage droops during overcurrent and short-circuit conditions.

9.1 Transient Protection

In the case of a short-circuit or device turn off during steady-state when the device interrupts current flow, the input inductance generates a positive voltage spike on the input, and the output inductance generates a negative voltage spike on the output. The peak amplitude of voltage spikes (transients) is dependent on the value of inductance in series to the input or output of the device. Such transients can exceed the absolute maximum ratings of the device if steps are not taken to address the issue. Typical methods for addressing transients include:

- Minimize lead length and inductance into and out of the device.
- Use a large PCB GND plane.
- Connect a Schottky diode from the OUT pin ground to absorb negative spikes.
- Connect a low ESR capacitor larger than $1\text{ }\mu\text{F}$ at the OUT pin very close to the device.
- Use a low-value ceramic capacitor $C_{IN} = 1\text{ }\mu\text{F}$ to absorb the energy and dampen the transients. The capacitor voltage rating must be at least twice the input supply voltage to be able to withstand the positive voltage excursion during inductive ringing.

Use [Equation 15](#) to estimate the approximate value of input capacitance:

$$V_{SPIKE(Absolute)} = V_{IN} + I_{LOAD} \times \sqrt{\frac{L_{IN}}{C_{IN}}} \quad (15)$$

where

- V_{IN} is the nominal supply voltage.
- I_{LOAD} is the load current.
- L_{IN} equals the effective inductance seen looking into the source.
- C_{IN} is the capacitance present at the input.
- Some applications can require the addition of a Transient Voltage Suppressor (TVS) to prevent transients from exceeding the absolute maximum ratings of the device. In some cases, even if the maximum amplitude of the transients is below the absolute maximum rating of the device, a TVS can help to absorb the excessive energy dump and prevent it from creating very fast transient voltages on the input supply pin of the IC, which can couple to the internal control circuits and cause unexpected behavior.

[Figure 9-1](#) shows the circuit implementation with optional protection components.

Figure 9-1. Circuit Implementation with Optional Protection Components

9.2 Output Short-Circuit Measurements

Obtaining repeatable and similar short-circuit testing results is difficult. The following contribute to variation in results:

- Source bypassing
- Input leads
- Circuit layout
- Component selection
- Output shorting method
- Relative location of the short
- Instrumentation

The actual short exhibits a certain degree of randomness because it microscopically bounces and arcs. Ensure that configuration and methods are used to obtain realistic results. Do not expect to see waveforms exactly like those in this data sheet because every setup is different.

10 Layout

10.1 Layout Guidelines

- For all applications, TI recommends a ceramic decoupling capacitor of 0.1 μF or greater between the IN terminal and GND terminal.
- The optimal placement of the decoupling capacitor is closest to the IN and GND terminals of the device. Care must be taken to minimize the loop area formed by the bypass-capacitor connection, the IN terminal, and the GND terminal of the IC.
- High current-carrying power-path connections must be as short as possible and must be sized to carry at least twice the full-load current.
- The GND terminal must be tied to the PCB ground plane at the terminal of the IC with the shortest possible trace. The PCB ground must be a copper plane or island on the board. TI recommends to have a separate ground plane island for the eFuse. This plane does not carry any high currents and serves as a quiet ground reference for all the critical analog signals of the eFuse. The device ground plane must be connected to the system power ground plane using a star connection.
- The IN and OUT pins are used for heat dissipation. Connect to as much copper area on top and bottom PCB layers using as possible with thermal vias. The vias under the device also help to minimize the voltage gradient across the IN and OUT pads and distribute current uniformly through the device, which is essential to achieve the best on-resistance and current sense accuracy.
- Locate the following support components close to their connection pins:
 - R_{IMON}
 - C_{dVdT}
 - Resistors for the EN/UVLO, $\overline{\text{EN}}$ /OVLO pins
- Connect the other end of the component to the GND pin of the device with shortest trace length. The trace routing for the R_{IMON} and C_{dVdT} components to the device must be as short as possible to reduce parasitic effects on the current monitor and soft start timing. These traces must not have any coupling to switching signals on the board.
- Protection devices such as TVS, snubbers, capacitors, or diodes must be placed physically close to the device they are intended to protect. These protection devices must be routed with short traces to reduce inductance. For example, TI recommends a protection Schottky diode to address negative transients due to switching of inductive loads. TI also recommends to add a ceramic decoupling capacitor of 1 μF or greater between OUT and GND. These components must be physically close to the OUT pins. Care must be taken to minimize the loop area formed by the Schottky diode/bypass-capacitor connection, the OUT pin and the GND terminal of the IC.

10.2 Layout Example

Figure 10-1. Layout Example

11 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

11.1 Documentation Support

11.1.1 Related Documentation

For related documentation see the following:

- Texas Instruments, [TPS22811EVM eFuse Evaluation Board](#)
- Texas Instruments, [TPS22811x Design Calculator](#)

11.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](#). Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

11.3 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

11.4 Trademarks

HotRod™ and TI E2E™ are trademarks of Texas Instruments.

All trademarks are the property of their respective owners.

11.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
TPS22811LRPWR	Active	Production	VQFN-HR (RPW) 10	3000 LARGE T&R	Yes	SN	Level-2-260C-1 YEAR	-40 to 125	2KZH
TPS22811LRPWR.A	Active	Production	VQFN-HR (RPW) 10	3000 LARGE T&R	Yes	SN	Level-2-260C-1 YEAR	-40 to 125	2KZH

- ⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).
- ⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.
- ⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.
- ⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
- ⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.
- ⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

- Pin 1: 2X (1.75) in, 4X (0.225) in
- Pin 2: 4X (0.475) in
- Pin 3: 4X (0.475) in
- Pin 4: 4X (0.475) in
- Pin 5: 2X (0.3) in
- Pin 6: 4X (0.25) in
- Pin 7: 4X (0.3) in, 4X (0.65) in
- Pin 8: 4X (0.25) in
- Pin 9: 4X (0.25) in
- Pin 10: 4X (0.25) in

Package Dimensions:

- Overall Width: 1.8 in (45.7 mm)
- Overall Height: 2.4 in (61 mm)
- Pin 1 to Pin 10 Distance: 1.45 in (36.8 mm)
- Pin 1 to Pin 5 Distance: 0.25 in (6.4 mm)
- Pin 5 to Pin 6 Distance: 0.25 in (6.4 mm)
- Pin 6 to Pin 7 Distance: 0.25 in (6.4 mm)
- Pin 7 to Pin 8 Distance: 0.6 in (15.2 mm)
- Pin 8 to Pin 9 Distance: 0.25 in (6.4 mm)
- Pin 9 to Pin 10 Distance: 0.25 in (6.4 mm)

Notes:

- (R0.05) TYP: Typical radius for the pins.
- PKG: Package dimensions.

The diagram illustrates two PCB manufacturing methods:

- NON- SOLDER MASK DEFINED (PREFERRED):** This method shows a rectangular area with a green border labeled "METAL" and a blue border labeled "SOLDER MASK OPENING". A dimension line indicates a "0.05 MAX ALL AROUND" gap between the metal and the solder mask opening. A black dot in the center is labeled "EXPOSED METAL".
- SOLDER MASK DEFINED:** This method shows a rectangular area with a blue border labeled "SOLDER MASK OPENING" and a green border labeled "METAL UNDER SOLDER MASK". A dimension line indicates a "0.05 MIN ALL AROUND" gap between the solder mask opening and the metal under the solder mask. A black dot in the center is labeled "EXPOSED METAL".

3. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
4. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SOLDER PASTE EXAMPLE
 BASED ON 0.100 mm THICK STENCIL

PADS 1, 4, 7 & 10: 93%; PADS 5 & 6: 82%
 SCALE: 30X

4225183/A 08/2019

NOTES: (continued)

5. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.
